Comments

Normochromic normocytic anaemia with low ferritin and transferrin saturation, consistent with iron deficiency on a background of inflammation. Renal function has declined since the comparison sample of 2026-04-02 (creatinine 101 umol/L, eGFR 64). Raised C-reactive protein and erythrocyte sedimentation rate are non-specific. Glycaemic control is above target. Suggest repeat urea and electrolytes within two weeks and review of the albumin/creatinine ratio on a first morning sample.
